

1. (Amended) A powder inhaler, comprising a  
powder container;  
an air channel through which air can be drawn via a mouthpiece;  
a metering member equipped with a dosing recess, the metering member  
being movable between a filling position in which the dosing recess can be filled with  
powder, and an inhalation position, in which the dosing recess, when filled, can be  
brought into the air channel, wherein a stream of inhaled air can discharge a dose of  
powder directly from the dosing recess;  
actuating means for the displacement of the metering member between the  
filling and the inhalation position; and  
a closure element adapted to plug the air channel around the metering  
member in a substantially water-proof manner, so as to protect the air channel  
around the metering member from moisture, when the metering member is in the  
filling position, and to open the air channel when the metering member is in the  
inhalation position.
2. (Amended) A powder inhaler according to claim 1, wherein the actuating  
means communicates or is connected with the closure element.
3. (Amended) A powder inhaler according to claim 1, comprising first sealing  
means to secure the substantially water-proof plugging of the air channel by the  
closure element.
4. (Amended) A powder inhaler according to claim 1, wherein the closure  
element is in the form of a closure plate connected to the actuating means.
5. (Amended) A powder inhaler according to claim 1, wherein the closure  
element is in the form of a pair of closure plates connected to the actuating means.
6. (Amended) A powder inhaler according to claim 4, wherein the closure  
plate is equipped with a hole and is slidably mounted across the air channel.

**Attorney Docket No. 06267.0086**

7. (Amended) A powder inhaler according to claim 3, wherein the first sealing means comprises an elastic seal fitted between the closure element and the wall portion of the air channel and means for pressing the closure element tightly against the seal when the inhaler is not actuated.

8. (Amended) A powder inhaler according to claim 7, wherein the means for pressing the closure element tightly against the seal comprises a wedge-formed element extending from the closure plate and adapted to contact with a pushing surface as the actuator returns to its rest position.

9. (Amended) A powder inhaler according to claim 1, wherein the metering member extends into the interior of the powder container.

10. (Amended) A powder inhaler according to claim 9, wherein the metering member is in the form of an axially movable metering rod equipped with a dosing recess.

11. (Amended) A powder inhaler according to claim 10, wherein the actuating means is a depressable device cover to which the metering rod is connected.

12. (Amended) A powder inhaler according to claim 3, further comprising an inhaler body, and further comprising second sealing means for providing substantially water-proof sealing between the actuating means and the inhaler body while allowing the movement of the actuating means in relation to the inhaler body.

13. (Amended) A powder inhaler of claim 12, wherein the second sealing means is in the form of an elastic tube comprising a corrugated wall.

14. (New) A powder inhaler according to claim 2, comprising first sealing means to secure the substantially water-proof plugging of the air channel by the closure element.

15. (Amended) A powder inhaler according to claim 5, wherein the closure plate is equipped with a hole and is slidably mounted across the air channel.
